

The smallest unit of energy is a photon

When a photon is set in motion

...it appears to divide itself ...

...into two oppositely charged, but equal in mass, particles ....

One particle has a positive charge, and clockwise rotation

The other particle has a negative charge, and counter-clockwise rotation

But wait .... Although two particles of light can be observed, each one with a measurable location in space and time, it turns out that they are not, in fact, two separate phenomena.

No matter how far apart, when one particle is made to spin faster ...

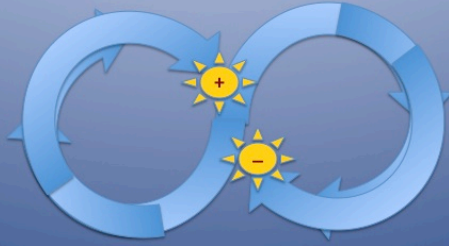

..the other particle increases its speed of rotation to the same degree...simultaneously!

Einstein referred to this as "spooky action at a distance"!

When these pairs of particles are forced together

in particle accelerators

they annihilate each other

in a blinding flash of light

**Thoughts are energies.**

The smallest unit of mental energy is a thought

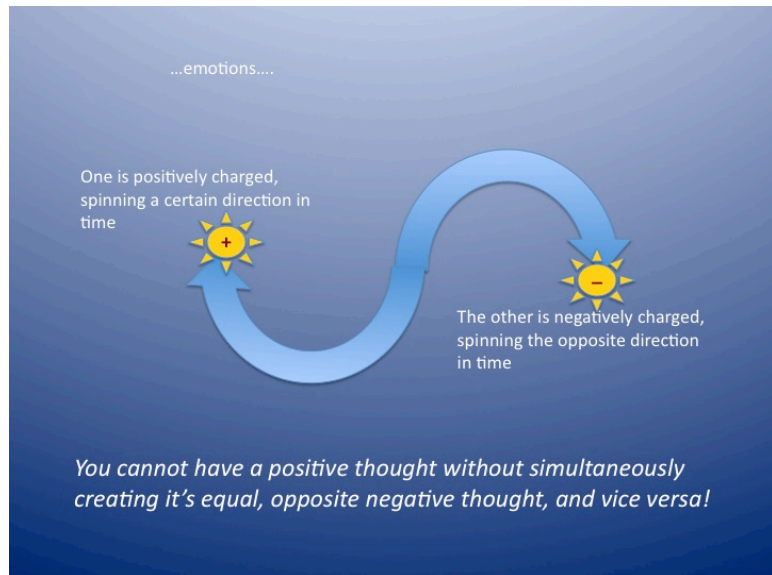

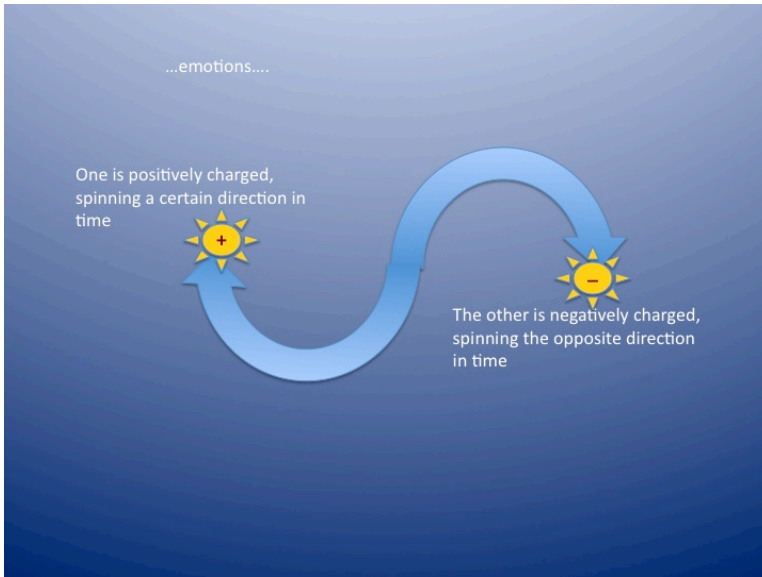

When a thought is set in motion (e in motion)

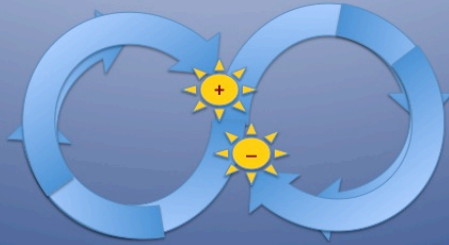

...it divides itself into two, simultaneously occurring...

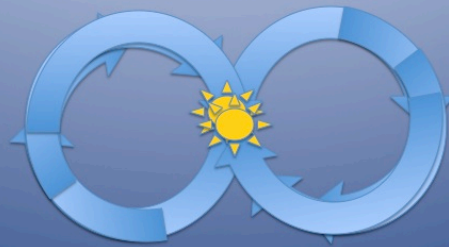

in your conscious mind

they annihilate each other

in a blinding flash of en-light-enment
